

# Computer Vision II - Lecture 13

## Multi-Object Tracking III

03.07.2014

**Bastian Leibe**

**RWTH Aachen**

<http://www.vision.rwth-aachen.de>

[leibe@vision.rwth-aachen.de](mailto:leibe@vision.rwth-aachen.de)

# Course Outline

- **Single-Object Tracking**
- **Bayesian Filtering**
  - Kalman filters
  - Particle filters
  - Case studies
- **Multi-Object Tracking**
  - Introduction
  - MHT, JPDAF
  - **Network Flow Optimization**
- **Articulated Tracking**

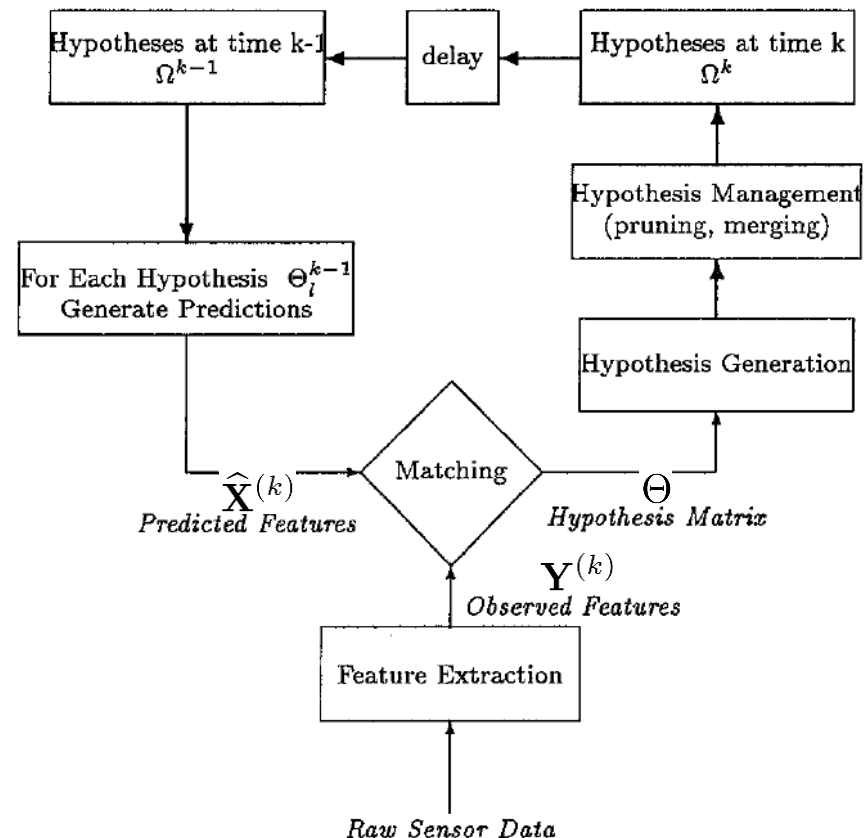

# Topics of This Lecture

- **Recap: MHT**
- **Data Association as Linear Assignment Problem**
  - LAP formulation
  - Greedy algorithm
  - Hungarian algorithm
- **Tracking as Network Flow Optimization**
  - Min-cost network flow
  - Generalizing to multiple frames
  - Complications
  - Formulation

# Recap: Multi-Hypothesis Tracking (MHT)

## • Ideas

- Instead of forming a track tree, keep a set of hypotheses that generate child hypotheses based on the associations.
- Enforce exclusion constraints between tracks and measurements in the assignment.
- Integrate track generation into the assignment process.
- After hypothesis generation, merge and prune the current hypothesis set.

D. Reid, [An Algorithm for Tracking Multiple Targets](#), IEEE Trans. Automatic Control, Vol. 24(6), pp. 843-854, 1979.

# Recap: Hypothesis Generation

- Create hypothesis matrix of the **feasible associations**

$$\Theta = \begin{array}{cccc} \mathbf{x}_1 & \mathbf{x}_2 & \mathbf{x}_{fa} & \mathbf{x}_{nt} \\ \left[ \begin{array}{cccc} 1 & 0 & 1 & 1 \\ 1 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 \\ 0 & 0 & 1 & 1 \end{array} \right] & \mathbf{y}_1 & \mathbf{y}_2 & \mathbf{y}_3 & \mathbf{y}_4 \end{array}$$

- Interpretation

- Columns represent tracked objects, rows encode measurements
- A non-zero element at matrix position  $(i, j)$  denotes that measurement  $y_i$  is contained in the validation region of track  $x_j$ .
- Extra column  $x_{fa}$  for association as *false alarm*.
- Extra column  $x_{nt}$  for association as *new track*.
- Turn this hypothesis matrix

# Recap: Assignments

$Z_j$	$\mathbf{x}_1$	$\mathbf{x}_2$	$\mathbf{x}_{fa}$	$\mathbf{x}_{nt}$
$\mathbf{y}_1$	0	0	1	0
$\mathbf{y}_2$	1	0	0	0
$\mathbf{y}_3$	0	1	0	0
$\mathbf{y}_4$	0	0	0	1

- **Impose constraints**

- A measurement can originate from only one object.

⇒ Any row has only a single non-zero value.

- An object can have at most one associated measurement per time step.

⇒ Any column has only a single non-zero value, except for  $\mathbf{x}_{fa}$ ,  $\mathbf{x}_{nt}$

# Recap: Calculating Hypothesis Probabilities

- Probabilistic formulation

- It is straightforward to enumerate all possible assignments.
- However, we also need to calculate the probability of each child hypothesis.
- This is done recursively:

$$p(\Omega_j^{(k)} | \mathbf{Y}^{(k)}) = p(Z_j^{(k)}, \Omega_{p(j)}^{(k-1)} | \mathbf{Y}^{(k)})$$

$$\stackrel{\text{Bayes}}{=} \eta p(\mathbf{Y}^{(k)} | Z_j^{(k)}, \Omega_{p(j)}^{(k-1)}) p(Z_j^{(k)}, \Omega_{p(j)}^{(k-1)})$$

$$= \underbrace{\eta p(\mathbf{Y}^{(k)} | Z_j^{(k)}, \Omega_{p(j)}^{(k-1)})}_{\text{Normalization factor}} \underbrace{p(Z_j^{(k)} | \Omega_{p(j)}^{(k-1)})}_{\text{Measurement likelihood}} \underbrace{p(\Omega_{p(j)}^{(k-1)})}_{\text{Prob. of assignment set}} \underbrace{p(\Omega_{p(j)}^{(k-1)})}_{\text{Prob. of parent}}$$

Normalization  
factor

Measurement  
likelihood

Prob. of  
assignment set

Prob. of  
parent

# Recap: Measurement Likelihood

- Use KF prediction

- Assume that a measurement  $\mathbf{y}_i^{(k)}$  associated to a track  $\mathbf{x}_j$  has a Gaussian pdf centered around the measurement prediction  $\hat{\mathbf{x}}_j^{(k)}$  with innovation covariance  $\hat{\Sigma}_j^{(k)}$ .
- Further assume that the pdf of a measurement belonging to a new track or false alarm is uniform in the observation volume  $W$  (the sensor's field-of-view) with probability  $W^{-1}$ .
- Thus, the measurement likelihood can be expressed as

$$\begin{aligned}
 p\left(\mathbf{Y}^{(k)} \mid Z_j^{(k)}, \Omega_{p(j)}^{(k-1)}\right) &= \prod_{i=1}^{M_k} \mathcal{N}\left(\mathbf{y}_i^{(k)}; \hat{\mathbf{x}}_j, \hat{\Sigma}_j^{(k)}\right)^{\delta_i} W^{-(1-\delta_i)} \\
 &= W^{-(N_{fal} + N_{new})} \prod_{i=1}^{M_k} \mathcal{N}\left(\mathbf{y}_i^{(k)}; \hat{\mathbf{x}}_j, \hat{\Sigma}_j^{(k)}\right)^{\delta_i}
 \end{aligned}$$

# Recap: Probability of an Assignment Set

$$p(Z_j^{(k)} | \Omega_{p(j)}^{(k-1)})$$

- Composed of three terms

1. Probability of the **number of tracks**  $N_{det}$ ,  $N_{fal}$ ,  $N_{new}$

- Assumption 1:  $N_{det}$  follows a binomial distribution

$$p(N_{det} | \Omega_{p(j)}^{(k-1)}) = \binom{N}{N_{det}} p_{det}^{N_{det}} (1 - p_{det})^{(N - N_{det})}$$

where  $N$  is the number of tracks in the parent hypothesis

- Assumption 2:  $N_{fal}$  and  $N_{new}$  both follow a Poisson distribution with expected number of events  $\lambda_{fal}W$  and  $\lambda_{new}W$

$$p(N_{det}, N_{fal}, N_{new} | \Omega_{p(j)}^{(k-1)}) = \binom{N}{N_{det}} p_{det}^{N_{det}} (1 - p_{det})^{(N - N_{det})} \cdot \mu(N_{fal}; \lambda_{fal}W) \cdot \mu(N_{new}; \lambda_{new}W)$$

# Recap: Probability of an Assignment Set

## 2. Probability of a **specific assignment of measurements**

- Such that  $M_k = N_{det} + N_{fal} + N_{new}$  holds.
- This is determined as 1 over the number of combinations

$$\binom{M_k}{N_{det}} \binom{M_k - N_{det}}{N_{fal}} \binom{M_k - N_{det} - N_{fal}}{N_{new}}$$

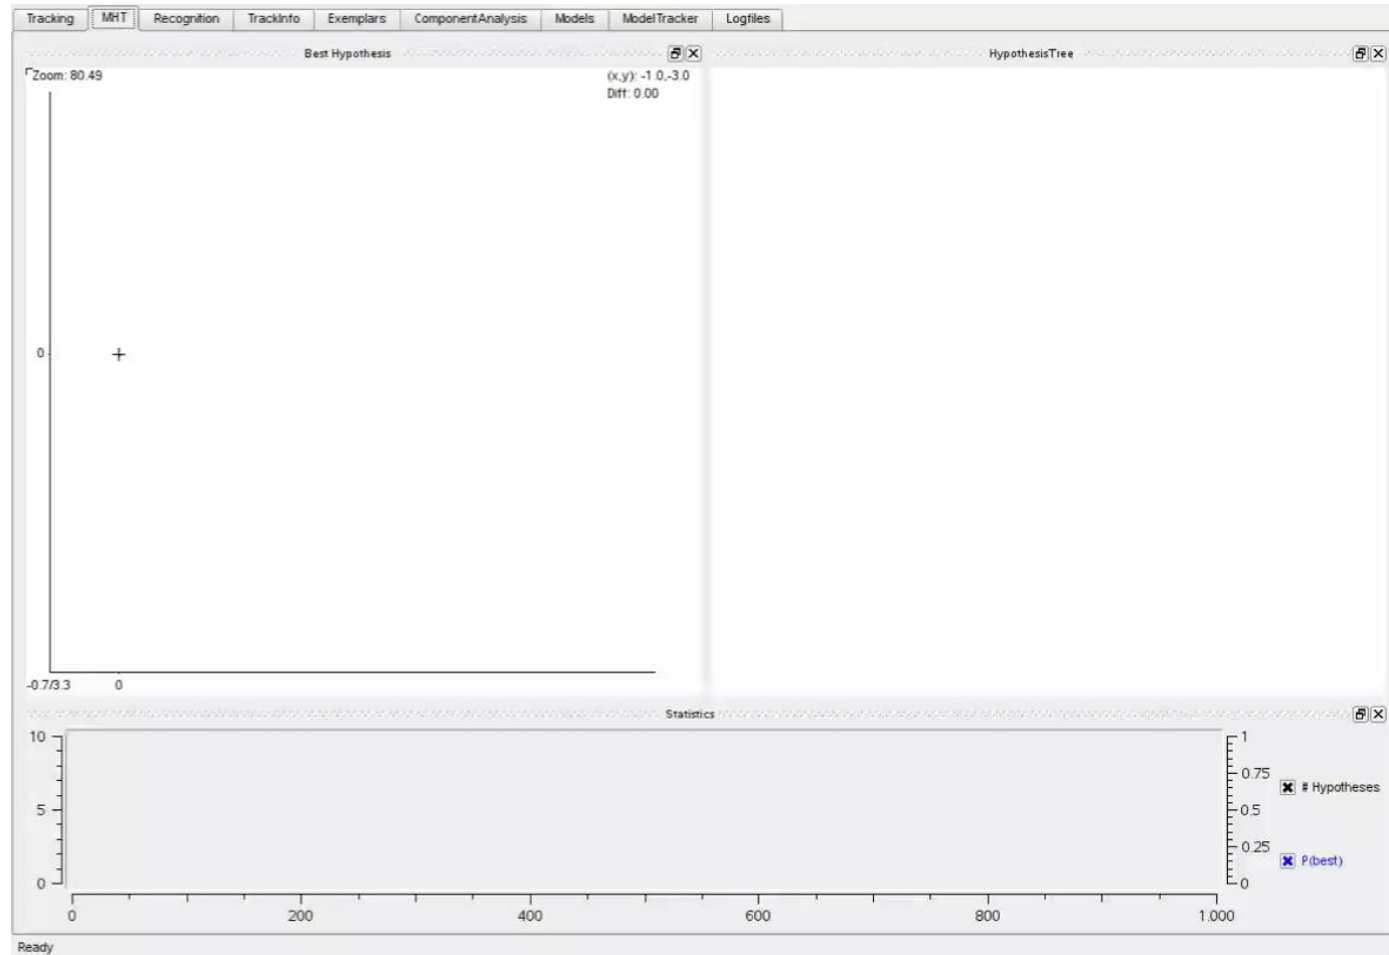

## 3. Probability of a **specific assignment of tracks**

- Given that a track can be either *detected* or not *detected*.
- This is determined as 1 over the number of assignments

$$\frac{N!}{(N - N_{det})!} \binom{N - N_{det}}{N_{det}}$$

⇒ When combining the different parts, many terms cancel out!

Social Robotics Laboratory

# Topics of This Lecture

- Recap: MHT
- **Data Association as Linear Assignment Problem**
  - LAP formulation
  - Greedy algorithm
  - Hungarian algorithm
- Tracking as Network Flow Optimization
  - Min-cost network flow
  - Generalizing to multiple frames
  - Complications
  - Formulation

# Back to Data Association...

- Goal: Match detections across frames

# Data Association

- **Main question here**
  - How to determine which measurements to add to which track?
  - Today: consider this as a matching problem

# Linear Assignment Formulation

- Form a matrix of pairwise similarity scores

- Similarity could be

- based on motion prediction
- based on appearance
- based on both

		Frame $t+1$		
				
Frame $t$		0.11	<b>0.95</b>	0.23
		0.85	0.25	<b>0.89</b>
		<b>0.90</b>	0.12	0.81

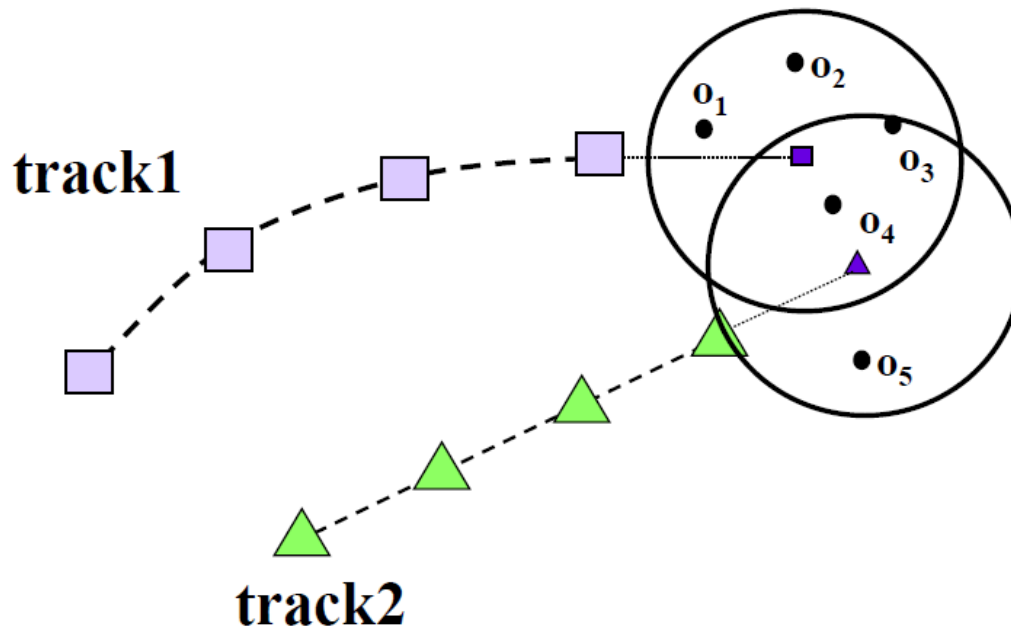

- Goal

- Choose one match from each row and column to maximize the sum of scores

# Linear Assignment Formulation

- Example: Similarity based on motion prediction
  - Predict motion for each trajectory and assign scores for each measurement based on inverse (Mahalanobis) distance, such that closer measurements get higher scores.

	ai1	ai2
1	3.0	
2	5.0	
3	6.0	1.0
4	9.0	8.0
5		3.0

- Choose at most one match in each row and column to maximize sum of scores

# Linear Assignment Problem

- Formal definition

- Maximize  $\sum_{i=1}^N \sum_{j=1}^M w_{ij} z_{ij}$

subject to  $\sum_{j=1}^M z_{ij} = 1; i = 1, 2, \dots, N$

$\sum_{i=1}^N z_{ij} = 1; j = 1, 2, \dots, M$

$z_{ij} \in \{0, 1\}$

Those constraints ensure that  $Z$  is a permutation matrix

- The permutation matrix constraint ensures that we can only match up one object from each row and column.
  - Note: Alternatively, we can minimize cost rather than maximizing weights.

$$\arg \min_{z_{ij}} \sum_{i=1}^N \sum_{j=1}^M c_{ij} z_{ij}$$

# Greedy Solution to LAP

	1	2	3	4	5
1	0.95	0.76	0.62	0.41	0.06
2	0.23	0.46	0.79	0.94	0.35
3	0.61	0.02	0.92	0.92	0.81
4	0.49	0.82	0.74	0.41	0.01
5	0.89	0.44	0.18	0.89	0.14

- **Greedy algorithm**
  - Find the largest score
  - Remove scores in same row and column from consideration
  - Repeat
- **Result: score =**

# Greedy Solution to LAP

	1	2	3	4	5
1	0.95	0.76	0.62	0.41	0.06
2	0.23	0.46	0.79	0.94	0.35
3	0.61	0.02	0.92	0.02	0.31
4	0.49	0.82	0.74	0.41	0.01
5	0.69	0.44	0.18	0.69	0.14

- Greedy algorithm
  - Find the largest score
  - Remove scores in same row and column from consideration
  - Repeat
- Result: score =  $0.95 + 0.94 + 0.92 + 0.82 + 0.14 = 3.77$

*Is this the best we can do?*

# Greedy Solution to LAP

	1	2	3	4	5
1	0.95	0.76	0.62	0.41	0.06
2	0.23	0.46	0.79	0.94	0.35
3	0.61	0.02	0.92	0.92	0.81
4	0.49	0.82	0.74	0.41	0.01
5	0.89	0.44	0.18	0.89	0.14

Greedy solution  
score = 3.77

	1	2	3	4	5
1	0.95	0.76	0.62	0.41	0.06
2	0.23	0.46	0.79	0.94	0.35
3	0.61	0.02	0.92	0.92	0.81
4	0.49	0.82	0.74	0.41	0.01
5	0.89	0.44	0.18	0.89	0.14

Optimal solution  
score = 4.26

## • Discussion

- Greedy method is easy to program, quick to run, and yields “pretty good” solutions in practice.
- But it often does not yield the optimal solution.

# Optimal Solution

- Hungarian Algorithm

- There is an algorithm called Kuhn-Munkres or “Hungarian” algorithm specifically developed to efficiently solve the linear assignment problem.
  - Reduces assignment problem to bipartite graph matching.
  - When starting from an  $N \times N$  matrix, it runs in  $\mathcal{O}(N^3)$ .
- ⇒ If you need LAP, you should use it.

- In the following

- Look at other algorithms that generalize to multi-frame (>2 frames) problems.
- ⇒ Min-Cost Network Flow

# Topics of This Lecture

- Recap: MHT
- Data Association as Linear Assignment Problem
  - LAP formulation
  - Greedy algorithm
  - Hungarian algorithm
- **Tracking as Network Flow Optimization**
  - **Min-cost network flow**
  - **Generalizing to multiple frames**
  - **Complications**
  - **Formulation**

# Min-Cost Flow

- Small example

	1	2	3
1	3	2	3
2	2	1	3
3	4	5	1

# Min-Cost Flow

- **Conversion into flow graph**

- Transform weights into costs  $c_{ij} = \alpha - w_{ij}$
- Add source/sink nodes with 0 cost.
- Directed edges with a capacity of 1.

# Min-Cost Flow

- **Conversion into flow graph**

- Pump  $N$  units of flow from source to sink.
  - Internal nodes pass on flow ( $\sum \text{flow in} = \sum \text{flow out}$ ).
- ⇒ Find the optimal paths along which to ship the flow.

# Min-Cost Flow

- Conversion into flow graph
  - Pump  $N$  units of flow from source to sink.
  - Internal nodes pass on flow ( $\sum \text{flow in} = \sum \text{flow out}$ ).
- ⇒ Find the optimal paths along which to ship the flow.

# Min-Cost Flow

- Solving the Min-Cost Flow problem

- There are standard algorithms for efficiently solving min-cost network flow
  - E.g., push-relabel or successive shortest path algorithms

# Min-Cost Flow

- **Nice property**

- Min-cost formalism readily generalizes to matching sets with unequal sizes.

# Using Network Flow for Tracking

- **Approach**

- Seek a globally optimal solution by considering observations over all frames in “batch mode”.
- ⇒ Extend two-frame min-cost formulation by adding observations from all frames into the network.

# Using Network Flow for Tracking

- **Complication 1**

- Tracks can start later than frame1 (and end earlier than frame4)  
⇒ Connect the source and sink nodes to all intermediate nodes.

# Using Network Flow for Tracking

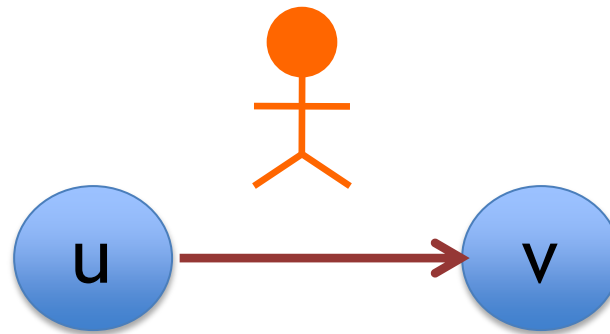

- **Complication 2**
  - Trivial solution: zero cost!

# Using Network Flow for Tracking

- Solution
  - Divide each detection into 2 nodes

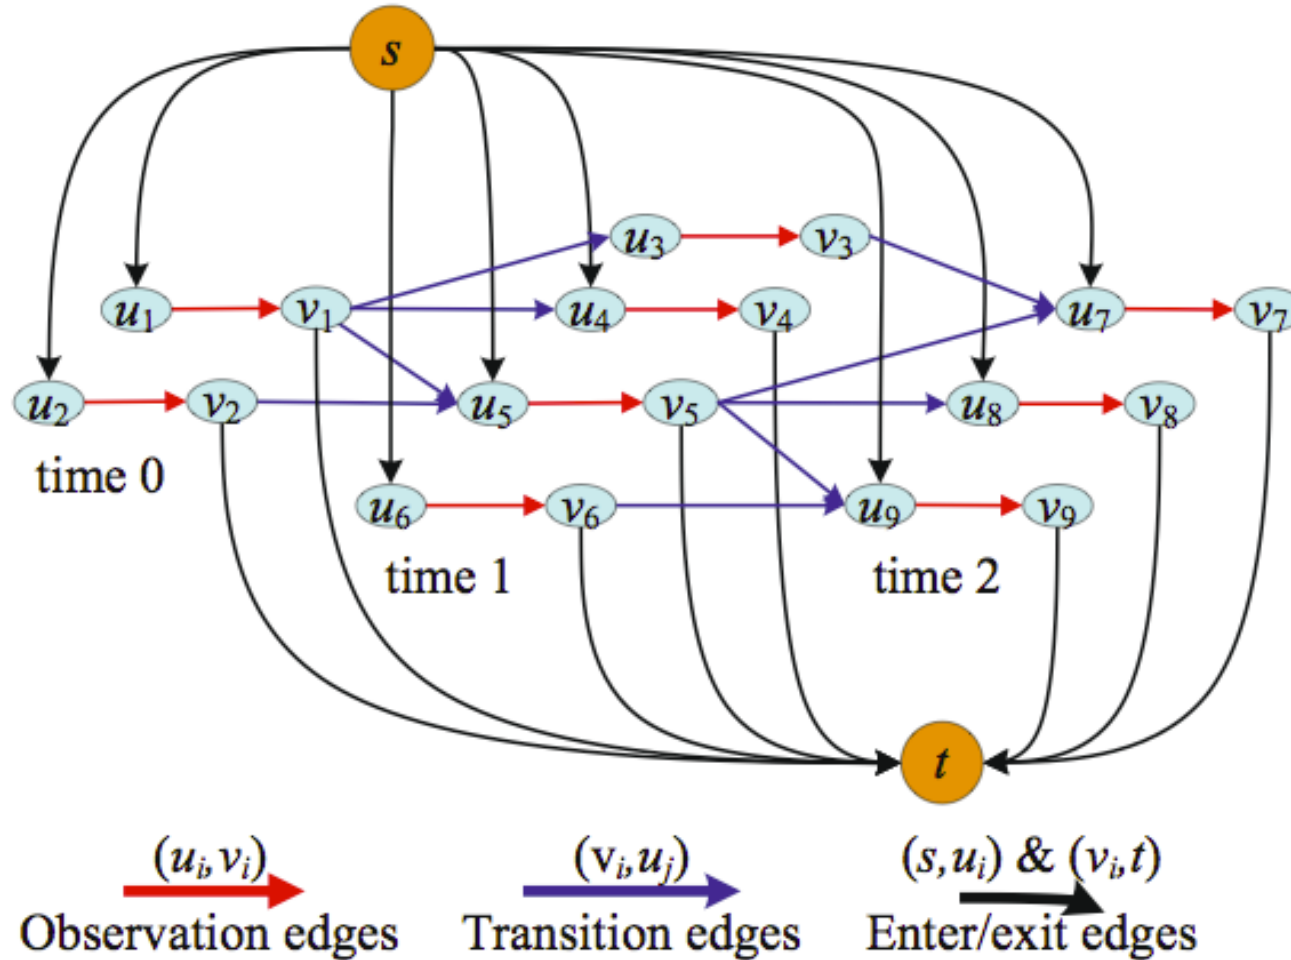

Detection edge

$$C_i = \log \frac{\beta_i}{1 - \beta_i}$$

← Probability that  
detection  $i$  is a  
false alarm

Frame t

Frame t+1

# Min-Cost Formulation

- Objective Function

$$\begin{aligned} \mathcal{T}^* = \operatorname{argmin}_{\mathcal{T}} & \sum_i C_{in,i} f_{in,i} + \sum_i C_{i,out} f_{i,out} \\ & + \sum_{i,j} C_{i,j} f_{i,j} + \sum_i C_i f_i \end{aligned}$$

- subject to

- Flow conservation at all nodes

$$f_{in,i} + \sum_j f_{j,i} = f_i = f_{out,i} + \sum_j f_{i,j} \quad \forall i$$

- Edge capacities

$$f_i \leq 1$$

# Min-Cost Formulation

- Objective Function

$$\mathcal{T}^* = \operatorname{argmin}_{\mathcal{T}} \sum_i C_{in,i} f_{in,i} + \sum_i C_{i,out} f_{i,out} \\ + \sum_{i,j} C_{i,j} f_{i,j} + \sum_i C_i f_i$$

$$C_i = -\log(P_i)$$

- Equivalent to Maximum A-Posteriori formulation

$$\mathcal{T}^* = \operatorname{argmax}_{\mathcal{T}} \prod_i P(\mathbf{o}_i | \mathcal{T}) P(\mathcal{T})$$

# Min-Cost Formulation

- Objective Function

$$\mathcal{T}^* = \operatorname{argmin}_{\mathcal{T}} \sum_i C_{in,i} f_{in,i} + \sum_i C_{i,out} f_{i,out}$$

$$+ \sum_{i,j} C_{i,j} f_{i,j} + \sum_i C_i f_i$$

TRANSITION

Likelihood of the detection

$$C_i = -\log(P_i)$$

- Equivalent to Maximum A-Posteriori formulation

$$\mathcal{T}^* = \operatorname{argmax}_{\mathcal{T}} \prod_i P(\mathbf{o}_i | \mathcal{T}) P(\mathcal{T})$$

Independence assumption

$$P(\mathcal{T}) = \prod_{T_k \in \mathcal{T}} P(T_k)$$
