

Computer Vision – Lecture 15

Epipolar Geometry & Stereo Basics

01.07.2019

Bastian Leibe
 Visual Computing Institute
 RWTH Aachen University
<http://www.vision.rwth-aachen.de/>
 leibe@vision.rwth-aachen.de

Course Outline

- Image Processing Basics
- Segmentation & Grouping
- Object Recognition & Categorization
- Local Features & Matching
- Deep Learning
- 3D Reconstruction
 - Epipolar Geometry and Stereo Basics
 - Camera calibration & Uncalibrated Reconstruction
 - Multi-view Stereo

Topics of This Lecture

- Geometric vision
 - Visual cues
 - Stereo vision
- Epipolar geometry
 - Depth with stereo
 - Geometry for a simple stereo system
 - Case example with parallel optical axes
 - General case with calibrated cameras
- Stereopsis & 3D Reconstruction
 - Correspondence search
 - Additional correspondence constraints
 - Possible sources of error
 - Applications

B. Leibe

Geometric vision

- Goal: Recovery of 3D structure
 - What cues in the image allow us to do this?

Slide credit: Svetlana Lazebnik

Visual Cues

- Shading

9

Computer Vision Summer'18

RWTH AACHEN UNIVERSITY

Our Goal: Recovery of 3D Structure

- We will focus on perspective and motion
- We need *multi-view geometry* because recovery of structure from one image is inherently ambiguous

Slide credit: Svetlana Lazebnik

B. Leibe

10

Computer Vision Summer'18

RWTH AACHEN UNIVERSITY

To Illustrate This Point...

- Structure and depth are inherently ambiguous from single views.

Slide credit: Svetlana Lazebnik, Kristen Grauman

11

Computer Vision Summer'18

RWTH AACHEN UNIVERSITY

Stereo Vision

http://www.well.com/~jim/stereo/stereo_list.html

Slide credit: Kristen Grauman

RWTH AACHEN UNIVERSITY

What Is Stereo Vision?

- Generic problem formulation: given several images of the same object or scene, compute a representation of its 3D shape

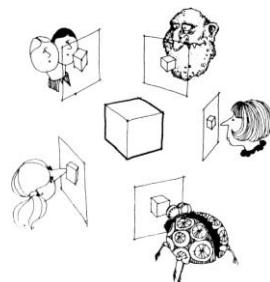

Slide credit: Svetlana Lazebnik, Steve Seitz, B. Leibe

13

RWTH AACHEN UNIVERSITY

What Is Stereo Vision?

- Generic problem formulation: given several images of the same object or scene, compute a representation of its 3D shape

Slide credit: Svetlana Lazebnik, Steve Seitz, B. Leibe

14

RWTH AACHEN UNIVERSITY

What Is Stereo Vision?

- Narrower formulation: given a calibrated binocular stereo pair, fuse it to produce a depth image

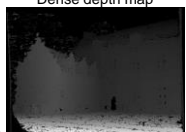

Image 1

Image 2

Dense depth map

RWTH AACHEN UNIVERSITY

Topics of This Lecture

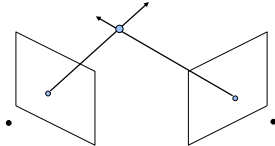

- Geometric vision
 - Visual cues
 - Stereo vision
- Epipolar geometry
 - Depth with stereo
 - Geometry for a simple stereo system
 - Case example with parallel optical axes
 - General case with calibrated cameras
- Stereopsis & 3D Reconstruction
 - Correspondence search
 - Additional correspondence constraints
 - Possible sources of error
 - Applications

Computer Vision Summer'18B. Leibe

20

RWTH AACHEN UNIVERSITY

Depth with Stereo: Basic Idea

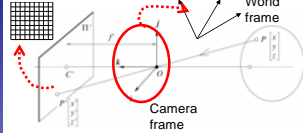

- Basic Principle: Triangulation
 - Gives reconstruction as intersection of two rays
 - Requires
 - Camera pose (calibration)
 - Point correspondence

Computer Vision Summer'18B. Leibe

21

RWTH AACHEN UNIVERSITY

Camera Calibration

Extrinsic parameters:
Camera frame ↔ Reference frame

Intrinsic parameters:
Image coordinates relative to camera ↔ Pixel coordinates

- Parameters
 - *Extrinsic*: rotation matrix and translation vector
 - *Intrinsic*: focal length, pixel sizes (mm), image center point, radial distortion parameters

We'll assume for now that these parameters are given and fixed.

Computer Vision Summer'18B. Leibe

22

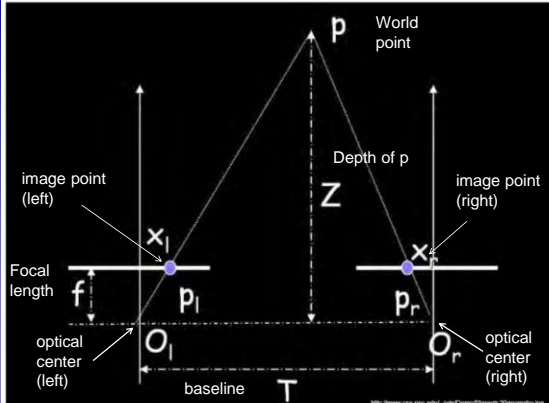

RWTH AACHEN UNIVERSITY

Geometry for a Simple Stereo System

- First, assuming parallel optical axes, known camera parameters (i.e., calibrated cameras):

Computer Vision Summer'18B. Leibe

23

World point p

Depth of p Z

image point (left) x_l

image point (right) x_r

Focal length f

optical center (left) O_l

optical center (right) O_r

baseline T

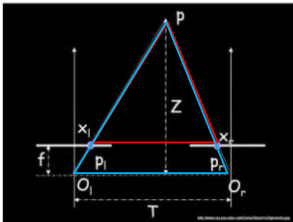

Points p_l and p_r are also labeled on the image planes.

Computer Vision Summer'18Slide credit: Kristen Grauman

RWTH AACHEN UNIVERSITY

Geometry for a Simple Stereo System

- Assume parallel optical axes, known camera parameters (i.e., calibrated cameras). We can triangulate via:

Similar triangles (p_l, P, p_r) and (O_l, P, O_r) :

$$\frac{T - (x_r - x_l)}{Z - f} = \frac{T}{Z}$$

$$Z = f \frac{T}{x_r - x_l}$$

"disparity" $\rightarrow x_r - x_l$

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 25

RWTH AACHEN UNIVERSITY

Depth From Disparity

Image $I(x, y)$

Disparity map $D(x, y)$

Image $I'(x', y')$

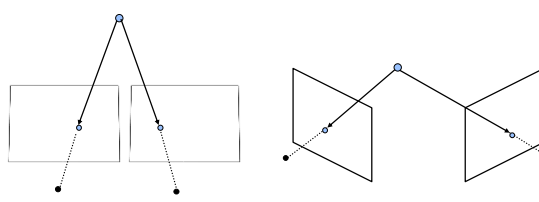

$$(x', y') = (x + D(x, y), y)$$

Computer Vision Summer'18 | B. Leibe | 26

RWTH AACHEN UNIVERSITY

General Case With Calibrated Cameras

- The two cameras need not have parallel optical axes.

vs.

Computer Vision Summer'18 | Slide credit: Kristen Grauman, Steve Seitz | B. Leibe | 27

RWTH AACHEN UNIVERSITY

Stereo Correspondence Constraints

p

p'?

- Given p in the left image, where can the corresponding point p' in the right image be?

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 28

RWTH AACHEN UNIVERSITY

Stereo Correspondence Constraints

p

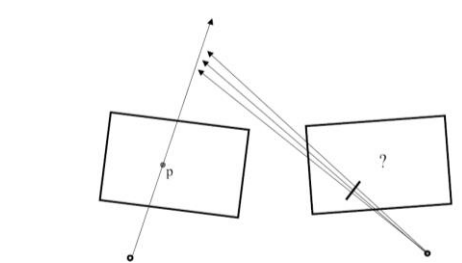

p'?

- Given p in the left image, where can the corresponding point p' in the right image be?

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 29

RWTH AACHEN UNIVERSITY

Stereo Correspondence Constraints

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 30

RWTH AACHEN UNIVERSITY

Stereo Correspondence Constraints

- Geometry of two views allows us to constrain where the corresponding pixel for some image point in the first view must occur in the second view.

- Epipolar constraint: Why is this useful?
 - Reduces correspondence problem to 1D search along conjugate epipolar lines.

31

RWTH AACHEN UNIVERSITY

Epipolar Geometry

- Epipolar Plane
- Baseline
- Epipoles
- Epipolar Lines

32

RWTH AACHEN UNIVERSITY

Epipolar Geometry: Terms

- Baseline**
 - Line joining the camera centers
- Epipole**
 - Point of intersection of baseline with the image plane
- Epipolar plane**
 - Plane containing baseline and world point
- Epipolar line**
 - Intersection of epipolar plane with the image plane
- Properties**
 - All epipolar lines intersect at the epipole.
 - An epipolar plane intersects the left and right image planes in epipolar lines.

33

RWTH AACHEN UNIVERSITY

Epipolar Constraint

- Potential matches for p have to lie on the corresponding epipolar line l .
- Potential matches for p' have to lie on the corresponding epipolar line l' .

<http://www.ai.sri.com/~luong/research/Meta3DViewer/EpipolarGeo.html>

34

RWTH AACHEN UNIVERSITY

Example

35

RWTH AACHEN UNIVERSITY

Example: Converging Cameras

As position of 3D point varies, epipolar lines "rotate" about the baseline

36

RWTH AACHEN UNIVERSITY

Example: Motion Parallel With Image Plane

Computer Vision Summer'18

Slide credit: Kristen Grauman B. Leibe Figure from Hartley & Zisserman

37

RWTH AACHEN UNIVERSITY

Example: Forward Motion

Computer Vision Summer'18

- Epipole has same coordinates in both images.
- Points move along lines radiating from e : "Focus of expansion"

Slide credit: Kristen Grauman B. Leibe Figure from Hartley & Zisserman

38

RWTH AACHEN UNIVERSITY

Let's Formalize This!

- For a given stereo rig, how do we express the epipolar constraints algebraically?
- For this, we will need some linear algebra.
- But don't worry! We'll go through it step by step...

Computer Vision Summer'18

Slide credit: B. Leibe

39

RWTH AACHEN UNIVERSITY

Stereo Geometry With Calibrated Cameras

- If the rig is calibrated, we know:
 - How to rotate and translate camera reference frame 1 to get to camera reference frame 2.
 - Rotation: 3 x 3 matrix; translation: 3 vector.

Computer Vision Summer'18

Slide credit: Kristen Grauman, Steve Seitz B. Leibe

40

RWTH AACHEN UNIVERSITY

Rotation Matrix

$$\mathbf{R}_x(\alpha) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \alpha & -\sin \alpha \\ 0 & \sin \alpha & \cos \alpha \end{bmatrix}$$

Express 3D rotation as series of rotations around coordinate axes by angles α, β, γ

$$\mathbf{R}_y(\beta) = \begin{bmatrix} \cos \beta & 0 & \sin \beta \\ 0 & 1 & 0 \\ -\sin \beta & 0 & \cos \beta \end{bmatrix}$$

Overall rotation is product of these elementary rotations:

$$\mathbf{R} = \mathbf{R}_x \mathbf{R}_y \mathbf{R}_z$$

$$\mathbf{R}_z(\gamma) = \begin{bmatrix} \cos \gamma & -\sin \gamma & 0 \\ \sin \gamma & \cos \gamma & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Computer Vision Summer'18

Slide credit: Kristen Grauman B. Leibe

41

RWTH AACHEN UNIVERSITY

3D Rigid Transformation

$$\begin{bmatrix} X' \\ Y' \\ Z' \end{bmatrix} = \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix} \begin{bmatrix} X \\ Y \\ Z \end{bmatrix} + \begin{bmatrix} T_x \\ T_y \\ T_z \end{bmatrix}$$

$$\mathbf{X}' = \mathbf{R}\mathbf{X} + \mathbf{T}$$

Computer Vision Summer'18

Slide credit: Kristen Grauman B. Leibe

42

RWTH AACHEN UNIVERSITY

Stereo Geometry With Calibrated Cameras

$\mathbf{p} = \begin{bmatrix} x \\ y \\ f \end{bmatrix}$

- Camera-centered coordinate systems are related by known rotation R and translation T :

$$\mathbf{X}' = R\mathbf{X} + \mathbf{T}$$

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 43

RWTH AACHEN UNIVERSITY

Excursion: Cross Product

$$\vec{a} \times \vec{b} = \vec{c} \quad \begin{aligned} \vec{a} \cdot \vec{c} &= 0 \\ \vec{b} \cdot \vec{c} &= 0 \end{aligned}$$

- Vector cross product takes two vectors and returns a third vector that's perpendicular to both inputs.
- So here, c is perpendicular to both a and b , which means the dot product is 0.

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 44

RWTH AACHEN UNIVERSITY

From Geometry to Algebra

$$\mathbf{X}' = R\mathbf{X} + \mathbf{T}$$

$$\mathbf{X}' \cdot (\mathbf{T} \times \mathbf{X}') = \mathbf{X}' \cdot (\mathbf{T} \times R\mathbf{X})$$

$$\mathbf{T} \times \mathbf{X}' = \mathbf{T} \times R\mathbf{X} + \mathbf{T} \times \mathbf{T}$$

$$0 = \mathbf{X}' \cdot (\mathbf{T} \times R\mathbf{X})$$

Normal to the plane $= \mathbf{T} \times R\mathbf{X}$

Computer Vision Summer'18 | Slide credit: Kristen Grauman | 45

RWTH AACHEN UNIVERSITY

Matrix Form of Cross Product

$$\vec{a} \times \vec{b} = \vec{c} \quad \begin{aligned} \vec{a} \cdot \vec{c} &= 0 \\ \vec{b} \cdot \vec{c} &= 0 \end{aligned}$$

"skew symmetric" matrix

$$[a_{\times}] = \begin{bmatrix} 0 & -a_z & a_y \\ a_z & 0 & -a_x \\ -a_y & a_x & 0 \end{bmatrix} \quad \vec{a} \times \vec{b} = [a_{\times}] \vec{b}$$

Computer Vision Summer'18 | Slide credit: Kristen Grauman | 46

RWTH AACHEN UNIVERSITY

From Geometry to Algebra

$$\mathbf{X}' = R\mathbf{X} + \mathbf{T}$$

$$\mathbf{X}' \cdot (\mathbf{T} \times \mathbf{X}') = \mathbf{X}' \cdot (\mathbf{T} \times R\mathbf{X})$$

$$\mathbf{T} \times \mathbf{X}' = \mathbf{T} \times R\mathbf{X} + \mathbf{T} \times \mathbf{T}$$

$$0 = \mathbf{X}' \cdot (\mathbf{T} \times R\mathbf{X})$$

Normal to the plane $= \mathbf{T} \times R\mathbf{X}$

Computer Vision Summer'18 | Slide credit: Kristen Grauman | 47

RWTH AACHEN UNIVERSITY

Essential Matrix

$$\mathbf{X}' \cdot (\mathbf{T} \times R\mathbf{X}) = 0$$

$$\mathbf{X}' \cdot (\mathbf{T} \times R\mathbf{X}) = 0$$

Let $\mathbf{E} = \mathbf{T} \times R$

$$\mathbf{X}'^T \mathbf{E} \mathbf{X} = 0$$

- This holds for the rays p and p' that are parallel to the camera-centered position vectors X and X' , so we have: $\mathbf{p}'^T \mathbf{E} \mathbf{p} = 0$
- E is called the **essential matrix**, which relates corresponding image points [Longuet-Higgins 1981]

Computer Vision Summer'18 | Slide credit: Kristen Grauman | B. Leibe | 48

RWTH AACHEN UNIVERSITY

Essential Matrix and Epipolar Lines

$\mathbf{p}'^T \mathbf{E} \mathbf{p} = 0$ Epipolar constraint: if we observe point p in one image, then its position p' in second image must satisfy this equation.

$\mathbf{l}' = \mathbf{E} \mathbf{p}$ is the coordinate vector representing the epipolar line for point p (i.e., the line is given by: $l'^T \mathbf{x} = 0$)

$\mathbf{l} = \mathbf{E}^T \mathbf{p}'$ is the coordinate vector representing the epipolar line for point p'

49

RWTH AACHEN UNIVERSITY

Essential Matrix: Properties

- Relates image of corresponding points in both cameras, given rotation and translation.
- Assuming intrinsic parameters are known

$\mathbf{E} = \mathbf{T} \cdot \mathbf{R}$

(i.e., the line is given by: $l'^T \mathbf{x} = 0$)

50

RWTH AACHEN UNIVERSITY

Essential Matrix Example: Parallel Cameras

$\mathbf{R} = \mathbf{I}$

$\mathbf{T} = [-d, 0, 0]^T$

$\mathbf{E} = [\mathbf{T}_x] \mathbf{R} = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & d \\ 0 & -d & 0 \end{bmatrix}$

$\mathbf{p}'^T \mathbf{E} \mathbf{p} = 0$

$$\begin{bmatrix} x' & y' & f \end{bmatrix} \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & d \\ 0 & -d & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ f \end{bmatrix} = 0$$

$$\Leftrightarrow \begin{bmatrix} x' & y' & f \end{bmatrix} \begin{bmatrix} 0 \\ df \\ -dy \end{bmatrix} = 0$$

$\Leftrightarrow y = y'$

For the parallel cameras, image of any point must lie on same horizontal line in each image plane.

51

RWTH AACHEN UNIVERSITY

More General Case

Image $I(x, y)$ Disparity map $D(x, y)$ Image $I'(x', y')$

$(x', y') = (x + D(x, y), y)$

What about when cameras' optical axes are not parallel?

52

RWTH AACHEN UNIVERSITY

Stereo Image Rectification

- In practice, it is convenient if image scanlines are the epipolar lines.
- Algorithm
 - Reproject image planes onto a common plane parallel to the line between optical centers
 - Pixel motion is horizontal after this transformation
 - Two homographies (3×3 transforms), one for each input image reprojected

53

RWTH AACHEN UNIVERSITY

Stereo Image Rectification: Example

54

Computer Vision Summer'18

Topics of This Lecture

- Geometric vision
 - Visual cues
 - Stereo vision
- Epipolar geometry
 - Depth with stereo
 - Geometry for a simple stereo system
 - Case example with parallel optical axes
 - General case with calibrated cameras
- Stereopsis & 3D Reconstruction
 - Correspondence search
 - Additional correspondence constraints
 - Possible sources of error
 - Applications

B. Leibe

55

Computer Vision Summer'18

Stereo Reconstruction

- Main Steps
 - Calibrate cameras
 - Rectify images
 - **Compute disparity**
 - Estimate depth

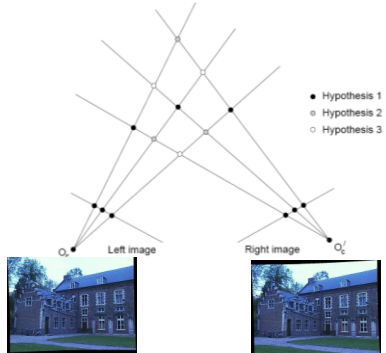

Slide credit: Kristen Grauman

B. Leibe

56

Computer Vision Summer'18

Correspondence Problem

Multiple match hypotheses satisfy epipolar constraint, but which is correct?

- Hypothesis 1
- Hypothesis 2
- Hypothesis 3

Left image

Right image

Slide credit: Kristen Grauman

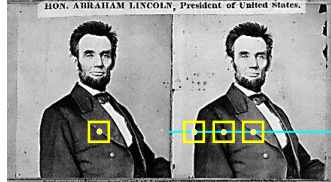

B. Leibe

Figure from Geis & Cioppa 1999

57

Computer Vision Summer'18

Dense Correspondence Search

- For each pixel in the first image
 - Find corresponding epipolar line in the right image
 - Examine all pixels on the epipolar line and pick the best match (e.g. SSD, correlation)
 - Triangulate the matches to get depth information
- This is easiest when epipolar lines are scanlines
 - ⇒ Rectify images first

adapted from Svetlana Lazebnik, Li Zhang

59

Computer Vision Summer'18

Example: Window Search

- Data from University of Tsukuba

Scene

Ground truth

Slide credit: Kristen Grauman

60

Computer Vision Summer'18

Example: Window Search

- Data from University of Tsukuba

Window-based matching (best window size)

Ground truth

Slide credit: Kristen Grauman

B. Leibe

61

RWTH AACHEN UNIVERSITY

Effect of Window Size

$W = 3$ $W = 20$

Want window large enough to have sufficient intensity variation, yet small enough to contain only pixels with about the same disparity.

62

Slide credit: Kristen Grauman B. Leibe Figures from Li Zhang

RWTH AACHEN UNIVERSITY

Alternative: Sparse Correspondence Search

HON. ABRAHAM LINCOLN, President of United States.

- Idea: Restrict search to sparse set of detected features
- Rather than pixel values (or lists of pixel values) use *feature descriptor* and an associated *feature distance*
- Still narrow search further by epipolar geometry

What would make good features?

63

Slide credit: Kristen Grauman B. Leibe

RWTH AACHEN UNIVERSITY

Dense vs. Sparse

- Sparse
 - Efficiency
 - Can have more reliable feature matches, less sensitive to illumination than raw pixels
 - But...
 - Have to know enough to pick good features
 - Sparse information
- Dense
 - Simple process
 - More depth estimates, can be useful for surface reconstruction
 - But...
 - Breaks down in textureless regions anyway
 - Raw pixel distances can be brittle
 - Not good with very different viewpoints

64

Slide credit: Kristen Grauman

RWTH AACHEN UNIVERSITY

Difficulties in Similarity Constraint

Untextured surfaces

Occlusions

65

Slide credit: Kristen Grauman B. Leibe

RWTH AACHEN UNIVERSITY

Possible Sources of Error?

- Low-contrast / textureless image regions
- Occlusions
- Camera calibration errors
- Violations of *brightness constancy* (e.g., specular reflections)
- Large motions
