RWTH AACHEN
UNIVERSITY

Course Outline

- Image Processing Basics
- Segmentation & Grouping
- Object Recognition
- Object Categorization I
 - Sliding Window based Object Detection
- Local Features & Matching
 - Local Features - Detection and Description
 - Recognition with Local Features
- Object Categorization II
 - Part based Approaches
- 3D Reconstruction
- Motion and Tracking

2

RWTH AACHEN
UNIVERSITY

Recap: Sliding-Window Object Detection

- If object may be in a cluttered scene, slide a window around looking for it.

- Essentially, this is a brute-force approach with many local decisions.

Computer Vision WS 14/15

B. Leibe

5

RWTH AACHEN
UNIVERSITY

Recap: AdaBoost Feature+Classifier Selection

- Want to select the single rectangle feature and threshold that best separates **positive** (faces) and **negative** (non-faces) training examples, in terms of **weighted error**.

Resulting weak classifier:

$$h_t(x) = \begin{cases} +1 & \text{if } f_t(x) > \theta_t \\ -1 & \text{otherwise} \end{cases}$$

For next round, reweight the examples according to errors, choose another filter/threshold combo.

Outputs of a possible rectangle feature on faces and non-faces.

[Viola & Jones, CVPR 2001]

6

Computer Vision WS 14/15

Recap: Viola-Jones Face Detector

- Train with 5K positives, 350M negatives
- Real-time detector using 38 layer cascade
- 6061 features in final layer
- [Implementation available in OpenCV: <http://sourceforge.net/projects/opencvlibrary/>]

Slide credit: Kristen Grauman B. Leibe

Computer Vision WS 14/15

Limitations of Sliding Windows (continued)

- Not all objects are "box" shaped

Slide credit: Kristen Grauman B. Leibe

Computer Vision WS 14/15

Limitations (continued)

- Non-rigid, deformable objects not captured well with representations assuming a fixed 2D structure; or must assume fixed viewpoint
- Objects with less-regular textures not captured well with holistic appearance-based descriptions

Slide credit: Kristen Grauman B. Leibe

Computer Vision WS 14/15

Limitations (continued)

- If considering windows in isolation, context is lost

Figure credit: Derek Hoiem B. Leibe

Computer Vision WS 14/15

Limitations (continued)

- In practice, often entails large, cropped training set (expensive)
- Requiring good match to a global appearance description can lead to sensitivity to partial occlusions

Image credit: Adam, Rivlin, B. Shimshoni K. Grauman, B. Leibe

Computer Vision WS 14/15

Topics of This Lecture

- **Local Invariant Features**
 - Motivation
 - Requirements, Invariances
- **Keypoint Localization**
 - Harris detector
 - Hessian detector
- **Scale Invariant Region Selection**
 - Automatic scale selection
 - Laplacian-of-Gaussian detector
 - Difference-of-Gaussian detector
 - Combinations
- **Local Descriptors**
 - Orientation normalization
 - SIFT

B. Leibe

Computer Vision WS 14/15

Motivation

- Global representations have major limitations
- Instead, describe and match only local regions
- Increased robustness to
 - Occlusions
 - Articulation
 - Intra-category variations

RWTH AACHEN UNIVERSITY

Application: Image Stitching

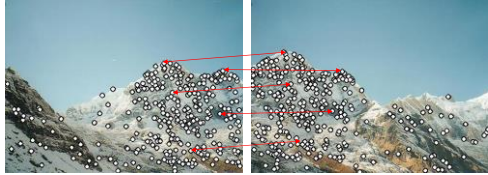

- Procedure:
 - Detect feature points in both images
 - Find corresponding pairs
 - Use these pairs to align the images

Computer Vision WS 14/15 23

Slide credit: Darva Frolova, Denis Simakov B. Leibe

RWTH AACHEN UNIVERSITY

General Approach

1. Find a set of distinctive keypoints
2. Define a region around each keypoint
3. Extract and normalize the region content
4. Compute a local descriptor from the normalized region
5. Match local descriptors

Computer Vision WS 14/15 24

B. Leibe

RWTH AACHEN UNIVERSITY

Common Requirements

- Problem 1:
 - Detect the same point *independently* in both images

No chance to match!

We need a repeatable detector!

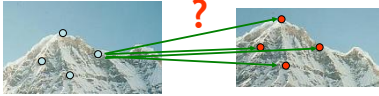

Computer Vision WS 14/15 25

Slide credit: Darva Frolova, Denis Simakov B. Leibe

RWTH AACHEN UNIVERSITY

Common Requirements

- Problem 1:
 - Detect the same point *independently* in both images
- Problem 2:
 - For each point correctly recognize the corresponding one

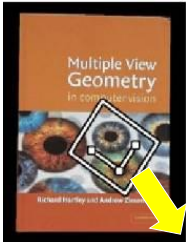

We need a reliable and distinctive descriptor!

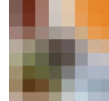

Computer Vision WS 14/15 26

Slide credit: Steve Seitz B. Leibe

RWTH AACHEN UNIVERSITY

Levels of Geometric Invariance

Computer Vision WS 14/15 28

B. Leibe

RWTH AACHEN UNIVERSITY

Requirements

- **Region extraction** needs to be **repeatable** and **accurate**
 - **Invariant** to translation, rotation, scale changes
 - **Robust** or **covariant** to out-of-plane (≠ affine) transformations
 - **Robust** to lighting variations, noise, blur, quantization
- **Locality**: Features are local, therefore robust to occlusion and clutter.
- **Quantity**: We need a sufficient number of regions to cover the object.
- **Distinctiveness**: The regions should contain “interesting” structure.
- **Efficiency**: Close to real-time performance.

Computer Vision WS 14/15 30

B. Leibe

RWTH AACHEN UNIVERSITY

Many Existing Detectors Available

| | |
|----------------------------------|-----------------------------|
| • Hessian & Harris | [Beaudet '78], [Harris '88] |
| • Laplacian, DoG | [Lindeberg '98], [Lowe '99] |
| • Harris-/Hessian-Laplace | [Mikolajczyk & Schmid '01] |
| • Harris-/Hessian-Affine | [Mikolajczyk & Schmid '04] |
| • EBR and IBR | [Tuytelaars & Van Gool '04] |
| • MSER | [Matas '02] |
| • Salient Regions | [Kadir & Brady '01] |
| • Others... | |

• *Those detectors have become a basic building block for many recent applications in Computer Vision.*

Computer Vision WS 14/15 32

B. Leibe

RWTH AACHEN UNIVERSITY

Keypoint Localization

- **Goals**:
 - Repeatable detection
 - Precise localization
 - Interesting content

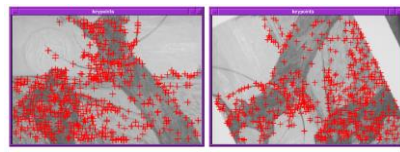

⇒ *Look for two-dimensional signal changes*

Computer Vision WS 14/15 33

B. Leibe

RWTH AACHEN UNIVERSITY

Finding Corners

- **Key property**:
 - In the region around a corner, image gradient has two or more dominant directions
- **Corners are repeatable and distinctive**

C.Harris and M.Stephens. "A Combined Corner and Edge Detector."
Proceedings of the 4th Alvey Vision Conference, 1988.

Computer Vision WS 14/15 34

Slide credit: Svetlana Lazebnik B. Leibe

RWTH AACHEN UNIVERSITY

Corners as Distinctive Interest Points

- Design criteria
 - We should easily recognize the point by looking through a small window (*locality*)
 - Shifting the window in *any direction* should give a *large change* in intensity (*good localization*)

"flat" region:
no change in all directions

"edge":
no change along the edge direction

"corner":
significant change in all directions

Computer Vision WS 14/15 35
Slide credit: Alexei Efros B. Leibe

RWTH AACHEN UNIVERSITY

Harris Detector Formulation

- Change of intensity for the shift $[u, v]$:

$$E(u, v) = \sum_{x, y} w(x, y) [I(x+u, y+v) - I(x, y)]^2$$

Window function $w(x, y) =$ 1 in window, 0 outside or Gaussian

Computer Vision WS 14/15 36
Slide credit: Rick Szeliski B. Leibe

RWTH AACHEN UNIVERSITY

Harris Detector Formulation

- This measure of change can be approximated by:

$$E(u, v) \approx [u \ v] M \begin{bmatrix} u \\ v \end{bmatrix}$$

where M is a 2×2 matrix computed from image derivatives:

$$M = \sum_{x, y} w(x, y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

Sum over image region - the area we are checking for corner

Gradient with respect to x , times gradient with respect to y

$$M = \begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} = \sum \begin{bmatrix} I_x \\ I_y \end{bmatrix} [I_x \ I_y]$$

Computer Vision WS 14/15 37
Slide credit: Rick Szeliski B. Leibe

RWTH AACHEN UNIVERSITY

Harris Detector Formulation

where M is a 2×2 matrix computed from image derivatives:

$$M = \sum_{x, y} w(x, y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

Sum over image region - the area we are checking for corner

Gradient with respect to x , times gradient with respect to y

$$M = \begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} = \sum \begin{bmatrix} I_x \\ I_y \end{bmatrix} [I_x \ I_y]$$

Computer Vision WS 14/15 38
Slide credit: Rick Szeliski B. Leibe

RWTH AACHEN UNIVERSITY

What Does This Matrix Reveal?

- First, let's consider an axis-aligned corner:

Computer Vision WS 14/15 39
Slide credit: Kristen Grauman B. Leibe

RWTH AACHEN UNIVERSITY

What Does This Matrix Reveal?

- First, let's consider an axis-aligned corner:

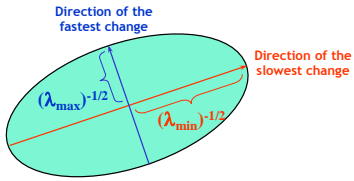

$$M = \begin{bmatrix} \sum I_x^2 & \sum I_x I_y \\ \sum I_x I_y & \sum I_y^2 \end{bmatrix} = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$

- This means:
 - Dominant gradient directions align with x or y axis
 - If either λ is close to 0, then this is not a corner, so look for locations where both are large.
- What if we have a corner that is not aligned with the image axes?

Computer Vision WS 14/15 40
Slide credit: David Jacobs B. Leibe

General Case

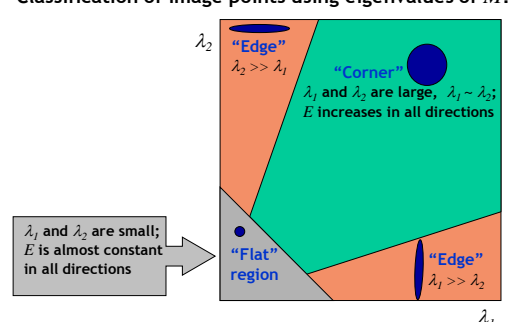

- Since M is symmetric, we have $M = R^{-1} \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} R$
(Eigenvalue decomposition)
- We can visualize M as an ellipse with axis lengths determined by the eigenvalues and orientation determined by R

Computer Vision WS 14/15
Slide credit: Kristen Grauman
B. Leibe
adapted from Darva Frolova, Denis Simakov
41

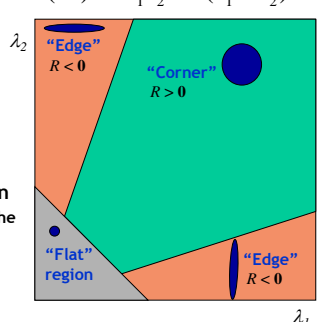

Interpreting the Eigenvalues

- Classification of image points using eigenvalues of M :

Computer Vision WS 14/15
Slide credit: Kristen Grauman
B. Leibe
42

Corner Response Function

$$R = \det(M) - \alpha \text{trace}(M)^2 = \lambda_1 \lambda_2 - \alpha (\lambda_1 + \lambda_2)^2$$

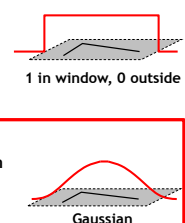

- Fast approximation
 - Avoid computing the eigenvalues
 - α : constant (0.04 to 0.06)

Computer Vision WS 14/15
Slide credit: Kristen Grauman
B. Leibe
43

Window Function $w(x,y)$

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

- Option 1: uniform window
 - Sum over square window
 - Problem: not rotation invariant
- Option 2: Smooth with Gaussian
 - Gaussian already performs weighted sum
 - Result is rotation invariant

Computer Vision WS 14/15
B. Leibe
44

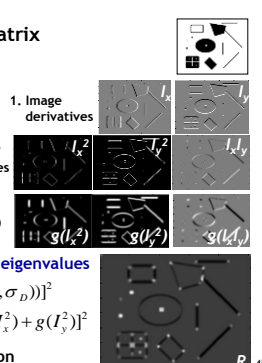

Summary: Harris Detector [Harris88]

- Compute second moment matrix (autocorrelation matrix)

$$M(\sigma_x, \sigma_y) = g(\sigma_x) * \begin{bmatrix} I_x^2(\sigma_y) & I_x I_y(\sigma_y) \\ I_x I_y(\sigma_x) & I_y^2(\sigma_x) \end{bmatrix}$$
- 1. Image derivatives
- 2. Square of derivatives
- 3. Gaussian filter $g(\sigma)$
- 4. Cornerness function - two strong eigenvalues

$$R = \det[M(\sigma_x, \sigma_y)] - \alpha [\text{trace}(M(\sigma_x, \sigma_y))]^2$$

$$= g(I_x^2)g(I_y^2) - [g(I_x I_y)]^2 - \alpha [g(I_x^2) + g(I_y^2)]^2$$
- 5. Perform non-maximum suppression

 - Orientation normalization
 - SIFT

59

RWTH AACHEN UNIVERSITY

From Points to Regions...

- The Harris and Hessian operators define interest points.
 - Precise localization
 - High repeatability

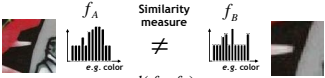

- In order to compare those points, we need to compute a descriptor over a region.
 - How can we define such a region in a scale invariant manner?
- i.e. how can we detect scale invariant interest regions?*

60

RWTH AACHEN UNIVERSITY

Naïve Approach: Exhaustive Search

Computer Vision WS 14/15

Automatic Scale Selection

- Solution:
 - Design a function on the region, which is "scale invariant" (the same for corresponding regions, even if they are at different scales)

Example: average intensity. For corresponding regions (even of different sizes) it will be the same.

- For a point in one image, we can consider it as a function of region size (patch width)

f Image 1 f Image 2
 Region size Region size
 scale = 1/2
 B. Leibe

Slide credit: Kristen Grauman

Computer Vision WS 14/15

Automatic Scale Selection

- Common approach:
 - Take a local maximum of this function.
 - Observation: region size for which the maximum is achieved should be *invariant* to image scale.

Important: this scale invariant region size is found in each image **independently!**

f Image 1 f Image 2
 Region size Region size
 scale = 1/2
 $s_2 = 1/2 s_1$

Technical Detail

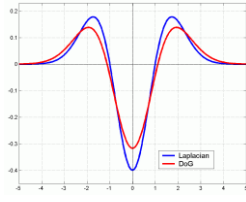

- We can efficiently approximate the Laplacian with a difference of Gaussians:

$$L = \sigma^2 (G_{xx}(x, y, \sigma) + G_{yy}(x, y, \sigma))$$

(Laplacian)

$$DoG = G(x, y, k\sigma) - G(x, y, \sigma)$$

(Difference of Gaussians)

Computer Vision WS 14/15

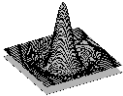

B. Leibe

84

RWTH AACHEN UNIVERSITY

Difference-of-Gaussian (DoG)

- Difference of Gaussians as approximation of the LoG
 - This is used e.g. in Lowe's SIFT pipeline for feature detection.
- Advantages
 - No need to compute 2nd derivatives
 - Gaussians are computed anyway, e.g. in a Gaussian pyramid.

Computer Vision WS 14/15

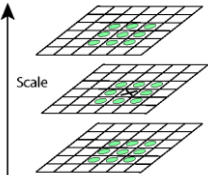

B. Leibe

85

RWTH AACHEN UNIVERSITY

Key point localization with DoG

- Detect maxima of difference-of-Gaussian (DoG) in scale space
- Then reject points with low contrast (threshold)
- Eliminate edge responses

RWTH AACHEN UNIVERSITY

Summary: Scale Invariant Detection

- **Given:** Two images of the same scene with a large *scale difference* between them.
- **Goal:** Find *the same* interest points *independently* in each image.
- **Solution:** Search for *maxima* of suitable functions in *scale* and in *space* (over the image).
- Two strategies
 - Laplacian-of-Gaussian (LoG)
 - Difference-of-Gaussian (DoG) as a fast approximation
 - *These can be used either on their own, or in combinations with single-scale keypoint detectors (Harris, Hessian).*

Image with displayed regions

Parameters defining an affine region

x_0, y_0, x_1, y_1 in $[-0.5, 0.5] \times [-0.5, 0.5]$ with $(x_1 - x_0)^2 + (y_1 - y_0)^2 = 1$ with (x_0, y_0) at image top-left corner

Code

provided by the authors, see [collaboration](#) for details and links to authors web sites

Linux binaries

| | | |
|----------------|--|------------|
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
| Example of use | <code>prompt> ./affine -i image1.in -mcount 10 -img1_size 1000 -img2_size 1000 -mcount 1000 -img2_size 1000</code> | Displaying |
